

#call: y #answer

#answer vs. #answer:

ContactView>>save

self answer: true

ContactView>>cancel

self answer: false

#answer vs. #answer:

```
ContactListView>>editContact: aContact
  | view |
  view := ContactView new.
  view contact: aContact.
  (self call: view)
     ifFalse: [ ^ nil ].
  self inform: 'Thanks for editing ' , aContact name
```

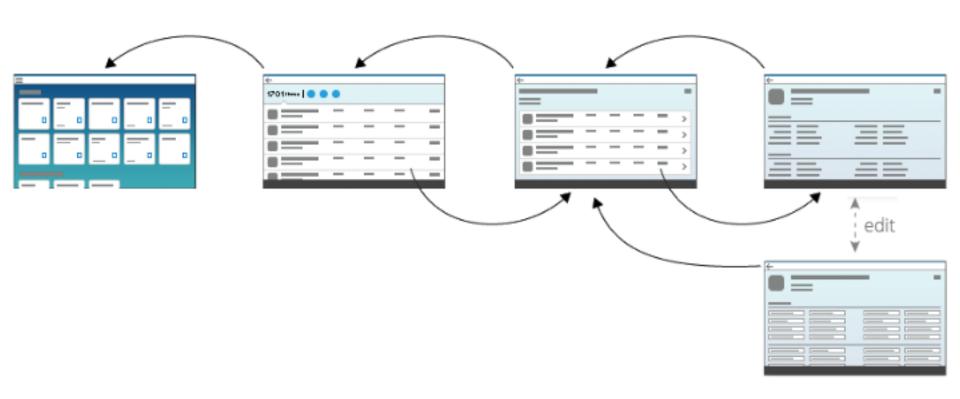

- Cuando el componente al que delegamos necesita un objeto del dominio, podemos optar entre:
 - Enviar el propio objeto
 - Enviar una copia

```
ContactListView>>editContact: aContact
    | view copy |
    view := ContactView new.
    copy := aContact copy.
    view contact: copy.
    (self call: view)
        ifTrue: [ Contact removeContact: aContact; addContact: copy ]
```

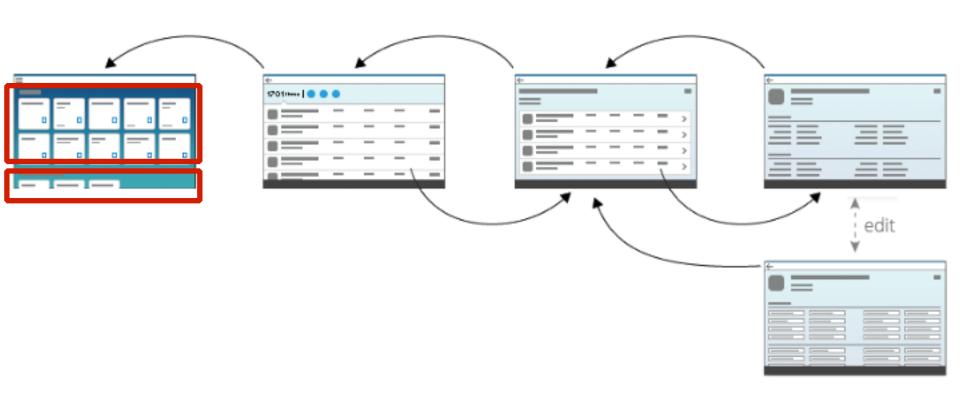

- Don't call while rendering:
 - http://book.seaside.st/book/components/calling/ dont-call-while-rendering
 - No usar #call: en el método #renderContentOn:
 - Solo en callbacks.

- Built-in Dialogs
 - WAComponent>>inform:
 - WAComponent>>confirm:
 - WAComponent>>request:
 - WAComponent>>chooseFrom:

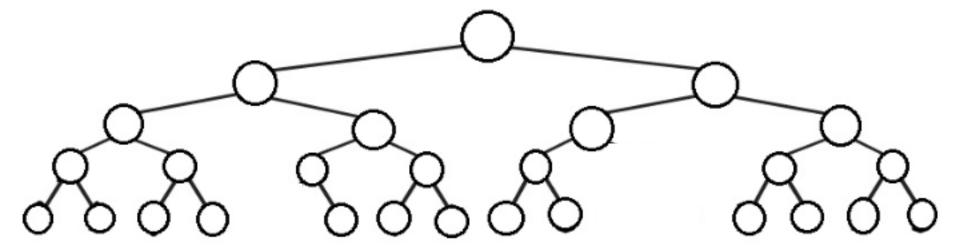

• ¿Que pasa si queremos mostrar varios componentes en la misma página?

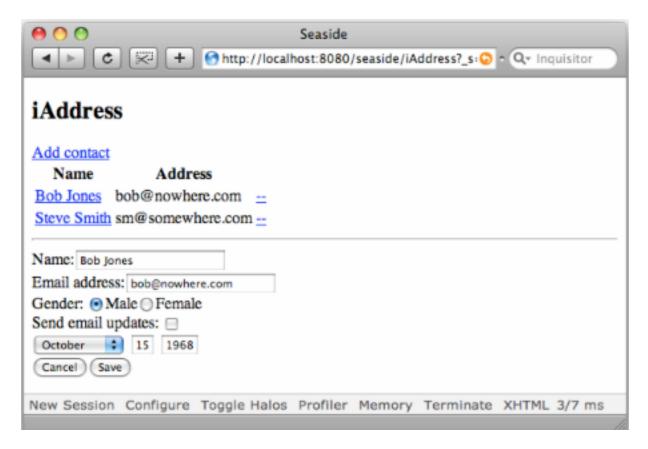

• ¿Que pasa si queremos mostrar varios componentes en la misma página?

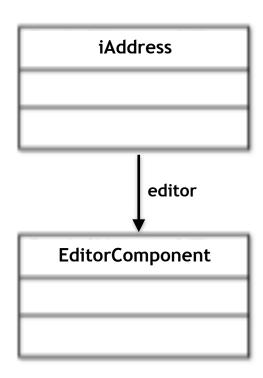

- Simplemente hacemos que un componente "conozca" a otros
 - Pero bajo cierto "formato" establecido por el framework

- Simplemente hacemos que un componente "conozca" a otros
 - Pero bajo cierto "formato" establecido por el framework
 - #children
 - en el método #renderContentOn: del "padre":
 - enviar mensaje #render: a HTMLCanvas con el componente hijo que se necesite como parámetro
